

Capsis: 1994-2014

A Generic Software Platform for forestry modelling

**and AMAPstudio: a Software Platform for Plants
Architecture Modelling**

Francois de Coligny (INRA AMAP)
Sébastien Griffon (Cirad AMAP)

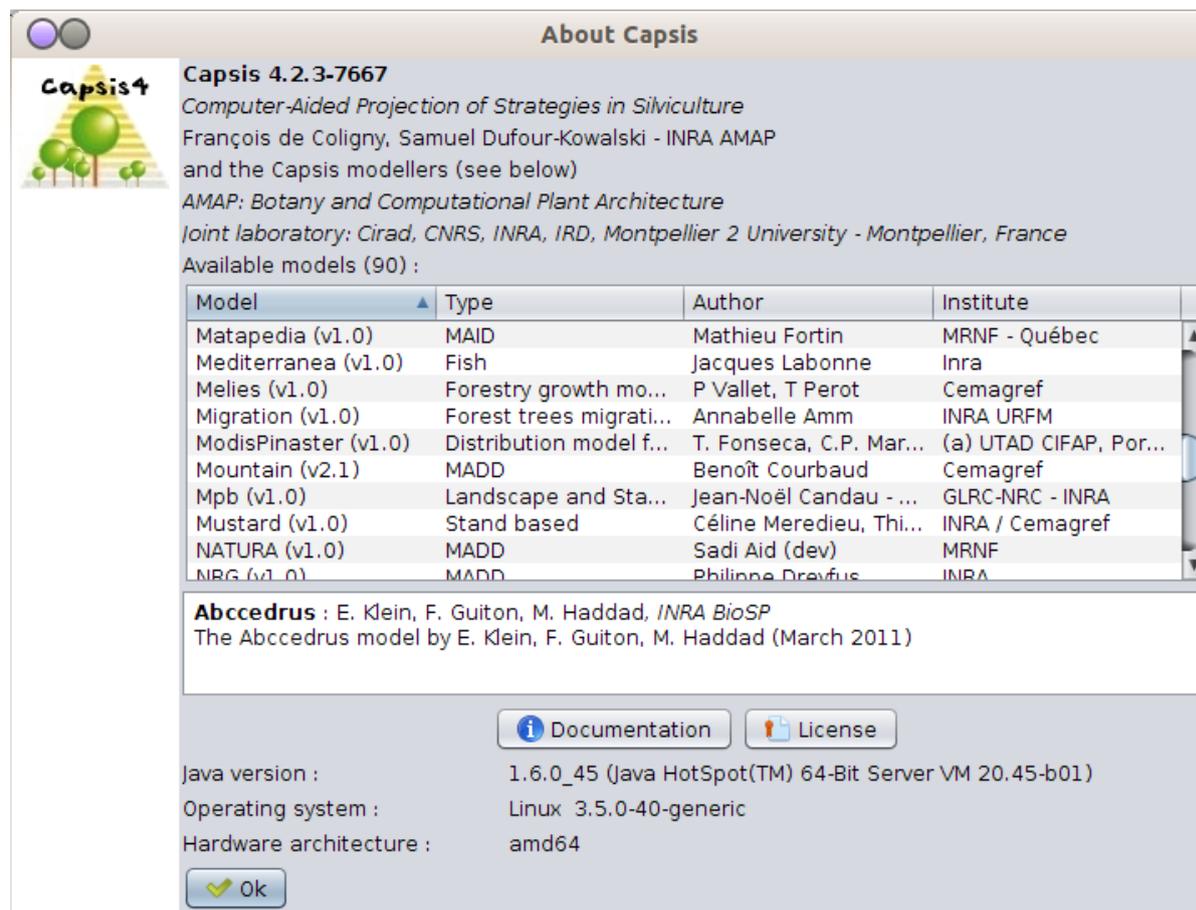

AMAP - Botany and Computational Plant Architecture
Montpellier, France

Capsis - Computer-Aided Projection of Strategies In Silviculture

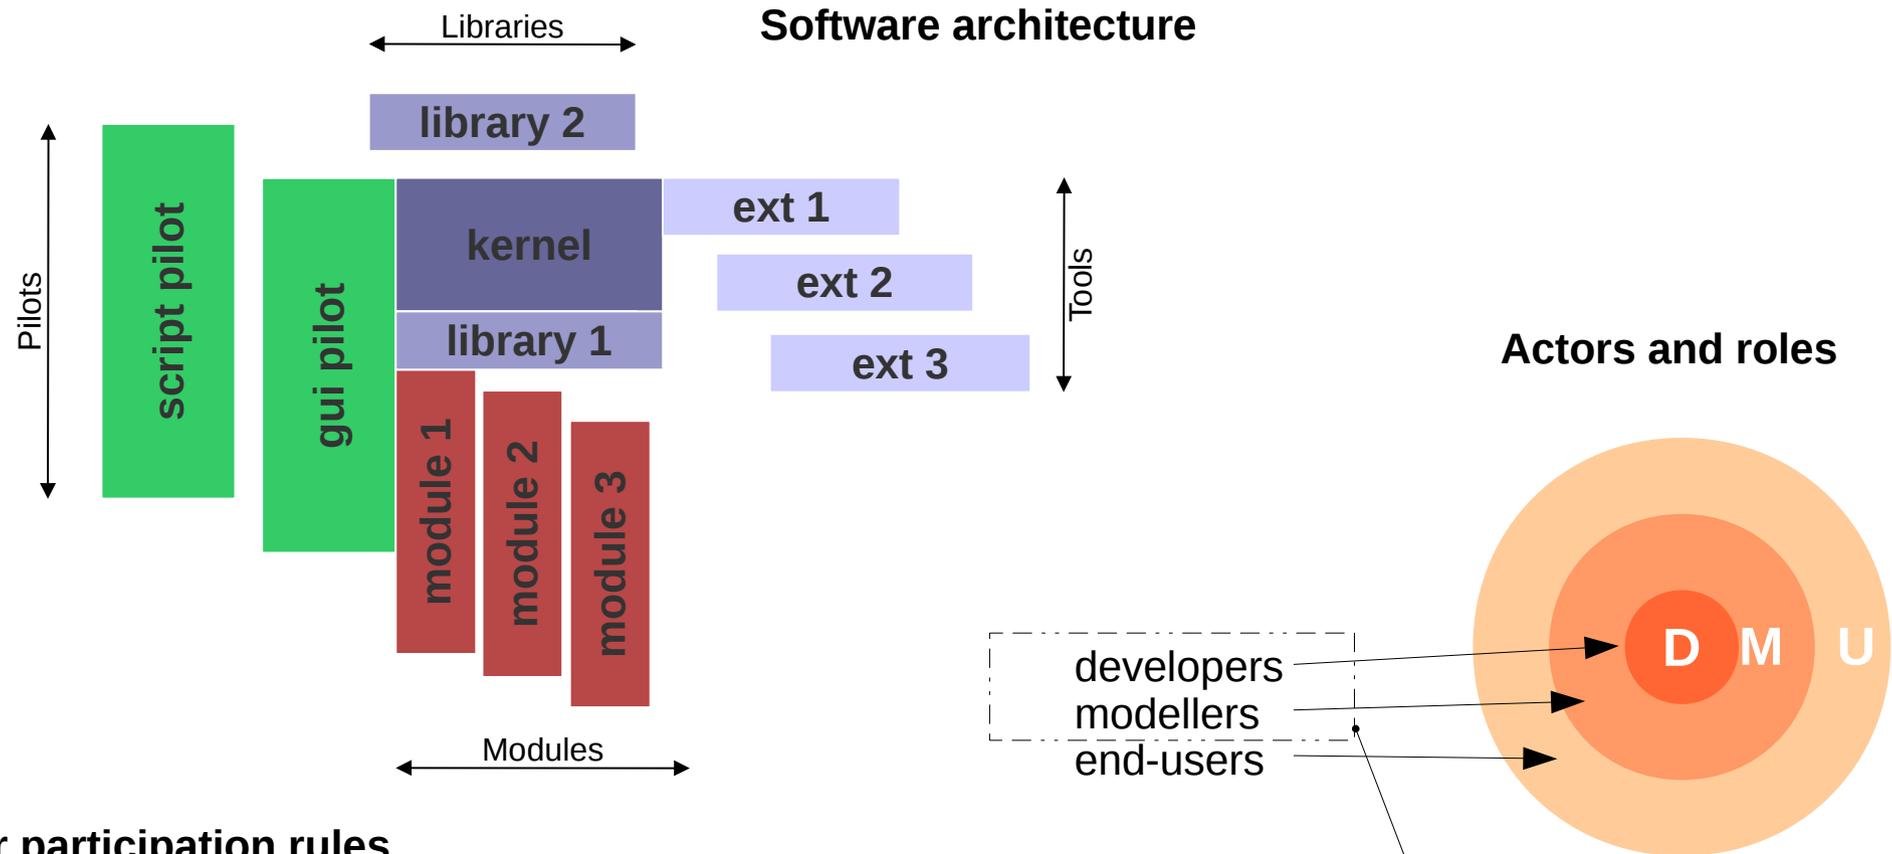

Objectives: Build a **software platform** to integrate forest growth & yield / dynamics models for modellers, managers and teaching

Started in 1994 by Philippe Dreyfus (INRA URFM, Avignon)

Capsis : main options

Clear participation rules

The common parts are free software (LGPL): everything except the **red parts** is reusable by anybody

The Capsis charter (extract):

- the modellers are in charge of the development of their models
- the growth models are not free: **red parts**
- all the source codes are freely accessible by all members in the Capsis community...

The Capsis community:
developers + modellers
co-develop together

Capsis Methodology: help the modellers develop by themselves

1. First together...

short training course (1-2 days)
scientists become beginner developers

+ customized starting session (2-3 days)
start developing together
work on the scientist's machine

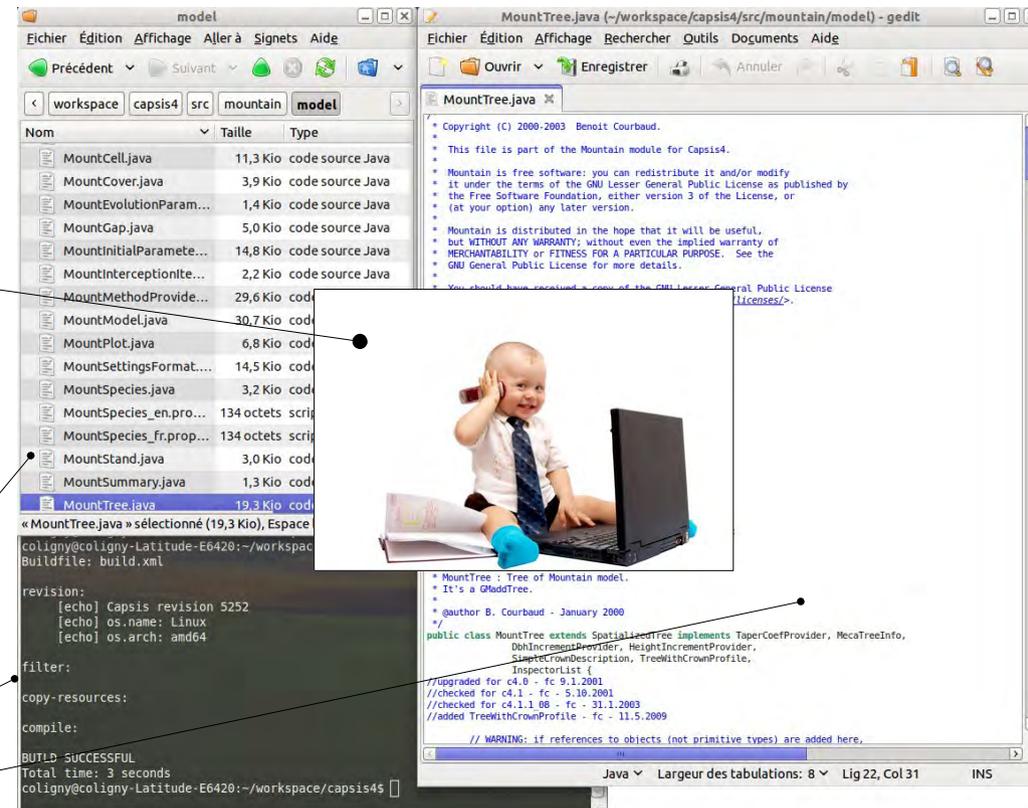

2. ...then in autonomy...

with a permanent and effective support
reactivity, availability

...with simple tools

an accessible language: Java
strict: accessible to scientists

a file manager
a terminal
a simple editor

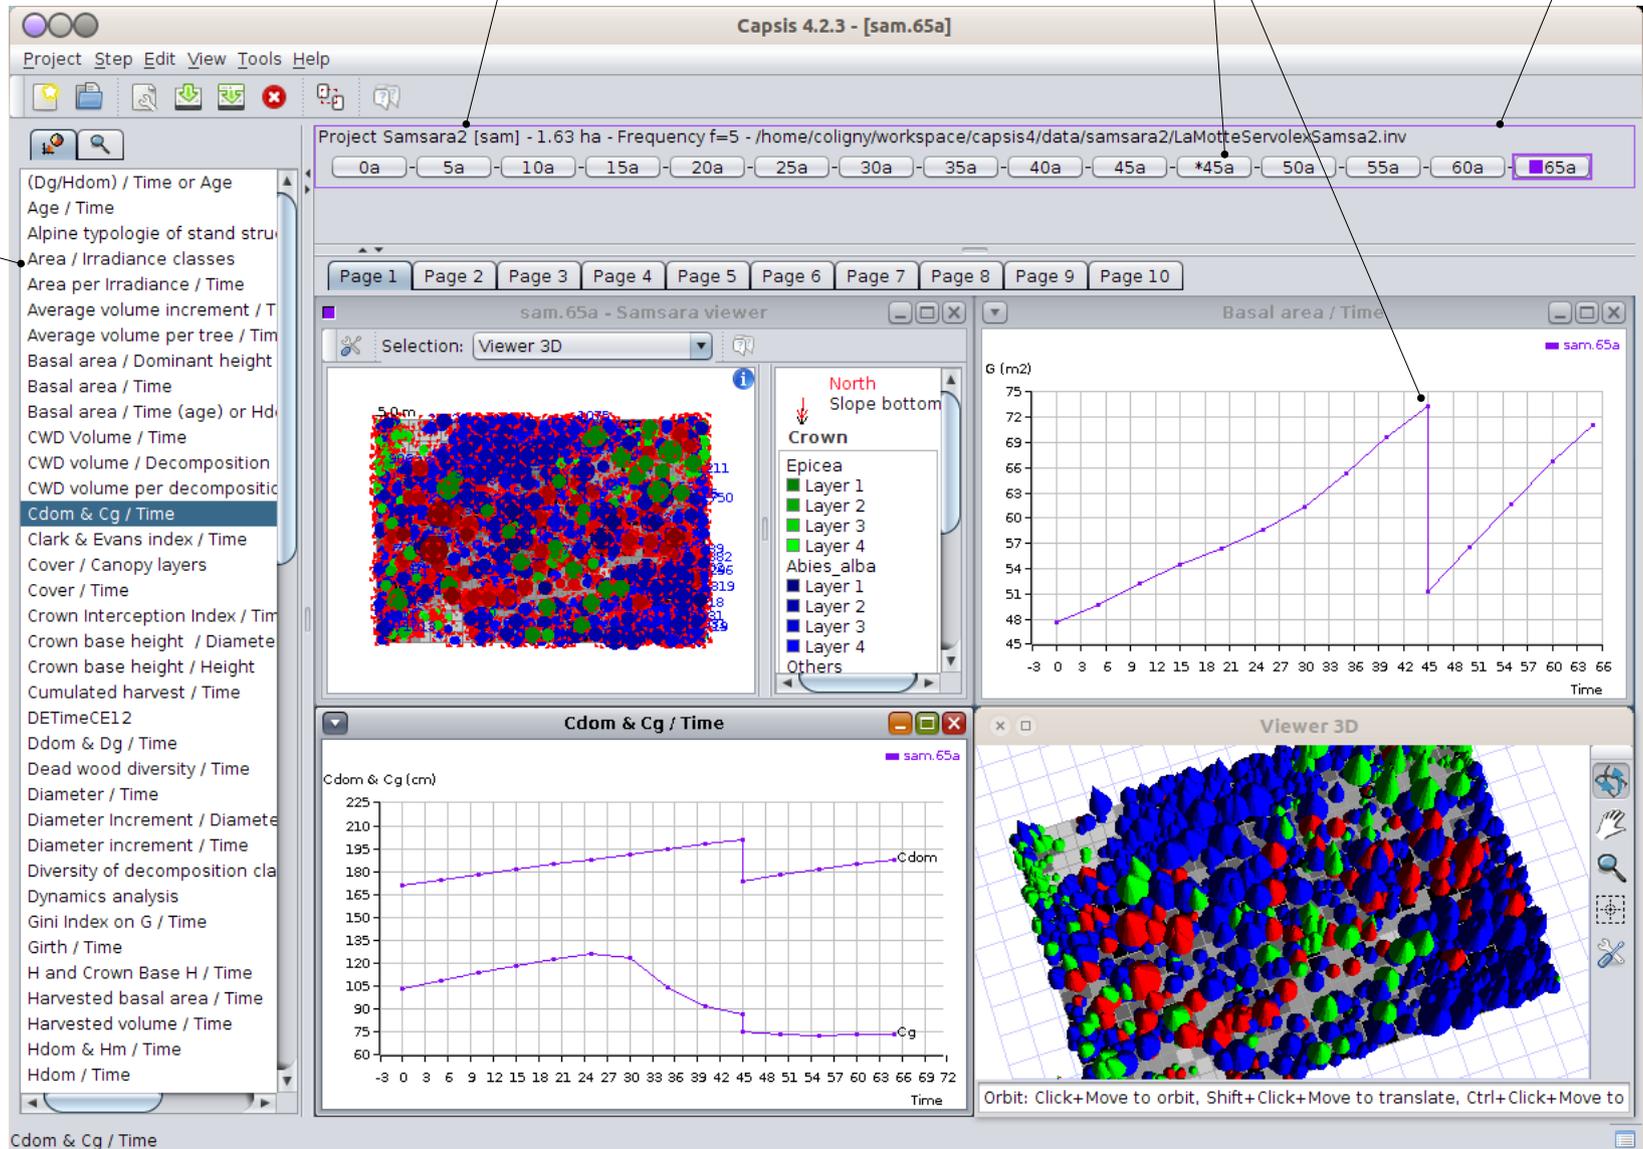

Capsis: how does it work ?

integrated viewers and charts

model :
initialisation
+ time loop

intervention

project

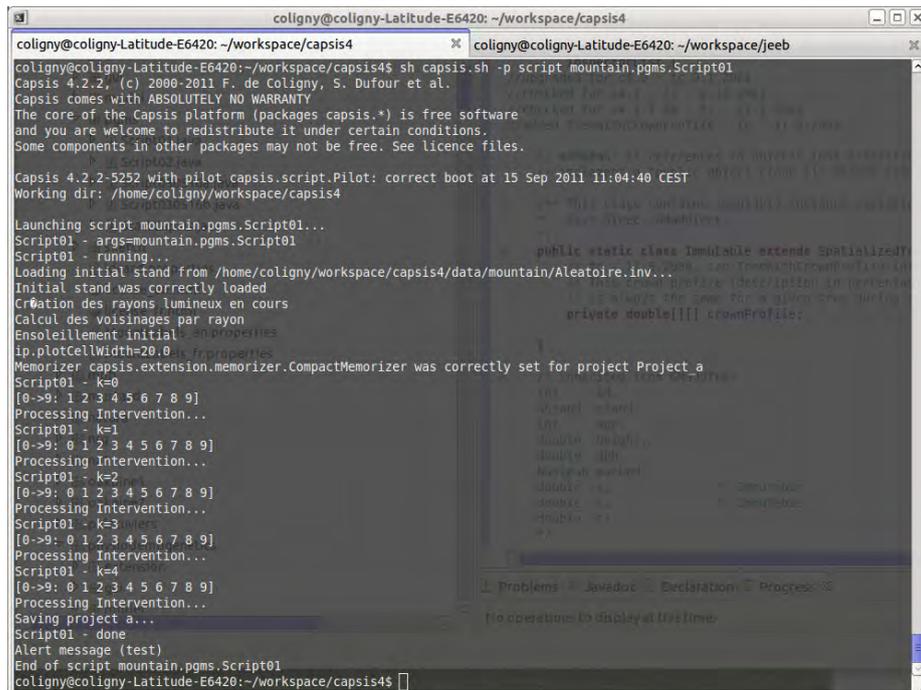

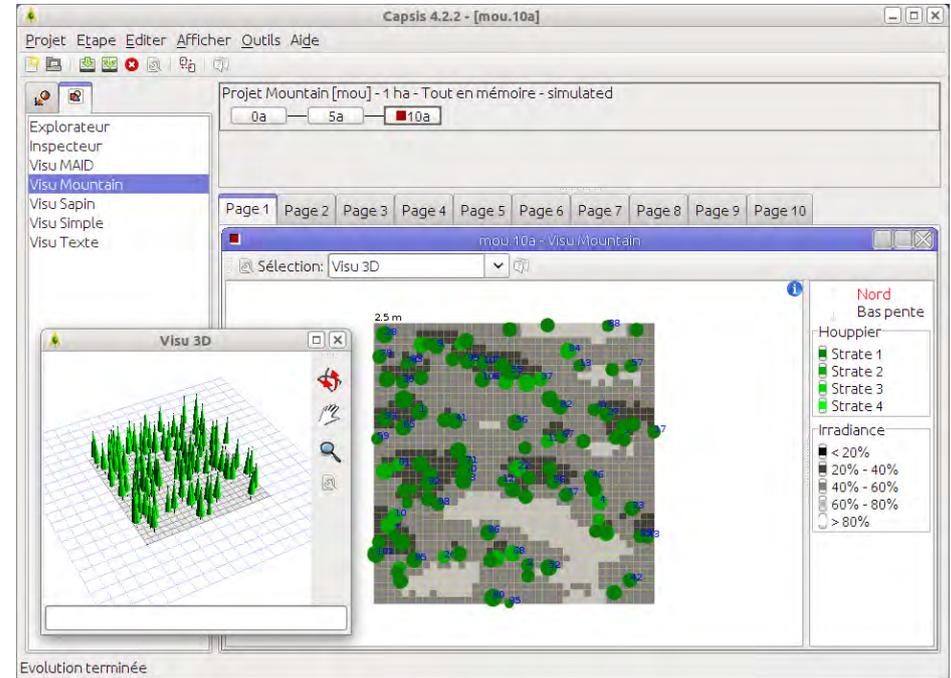

Capsis - Linux - Graphical user interface - English

Capsis 1994-2014 + AMAPstudio - Francois de Coligny (INRA AMAP) - ECCOREV - Aix en Provence - 8 Oct 2014

export

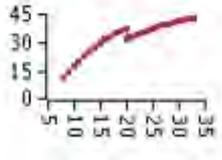

Capsis: several ways of use

Interactive (french / english)

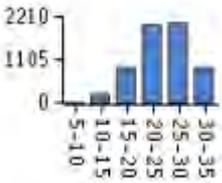

Not interactive: with scripts
- long simulations
- run on clusters
- sensitivity analyses...

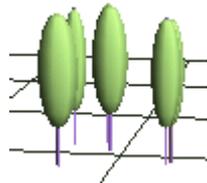

Models for maritime pine in the *Landes de Gascogne*

Lemoine model (stand level, plantation):
 - age, number of trees, girth (dominant, mean), basal area, height (dominant, mean), volume (mean)

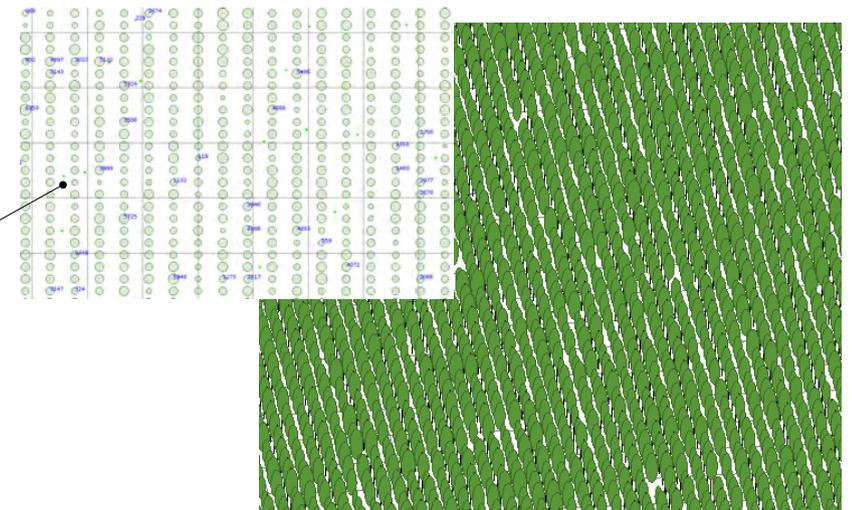

PP3 model (distribution model, plantation):
 a list of trees
 - age, diameter, height, volume of each tree, crown (height, diameter), other information (biomass, carbon, etc.) + number

Pinus Pinaster (individual-based, spatialized)
 a rewriting of PP3
 integration of spatialized processes

stumps

Applications, further works:

- a permanent resource analysis system (with IFN - National Forest Inventory)
- dead wood modelling and biodiversity
- models transfer to the silviculture prescribers

Fagacées: an individual-based model for oak and beech

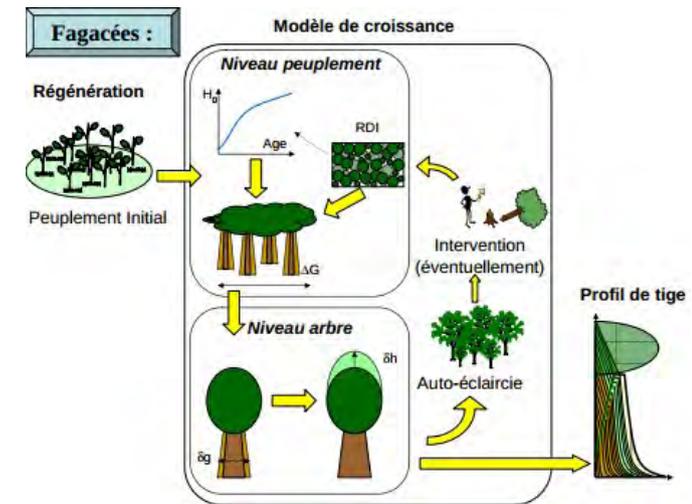

Fagacées relies on 5 fundamental relations at 2 levels

1. stand level

- a growth model for dominant height (H_0)
- a self thinning model giving the relative density index (RDI)
- a basal area (G) productivity model (Eichhorn)

2. tree level

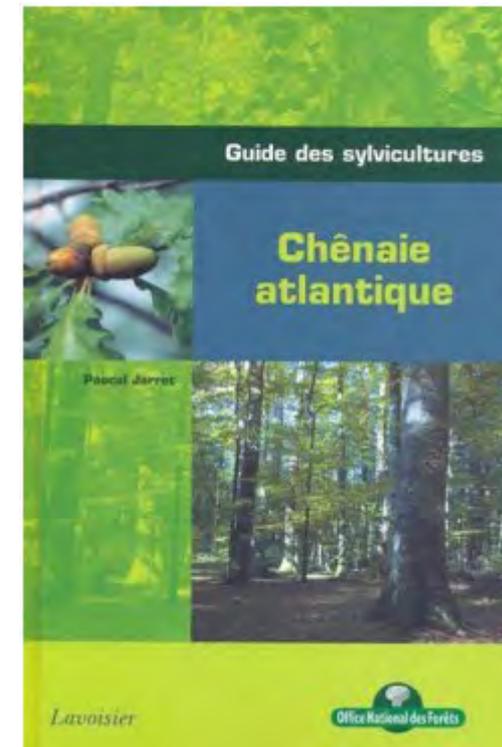

- a model for distributing the increases at the tree scale
- a height / diameter model

Work under progress on the model to help revise the ONF *Chênaie Atlantique* silvicultural guide (Pascal Jarret, 2004)

Changing context, climatic change, productivity change...

Le Moguédec G., Dhôte J.-F., 2012. Fagacées: a tree-centered growth and yield model for sessile oak (*Quercus petraea* L.) and common beech (*Fagus sylvatica* L.). **Annals of Forest Science** (2012) 69:257–269.

Oakpine: oak and pine growing at the same time

Quantify the impact of the spatial structure type on the productivity of oak-pine forests

Method:

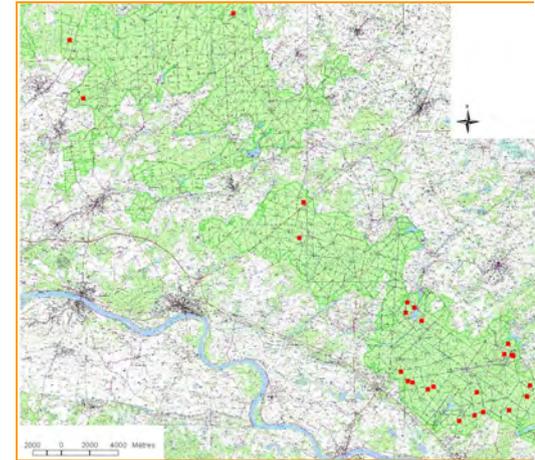

- simulate several types of realistic spatial structure (same list of trees)
- simulate growth for each structure type
- compare the obtained productivities

Spatial structure analysis on 34 plots:

typology: 4 types for the canopy / 3 types for the understorey

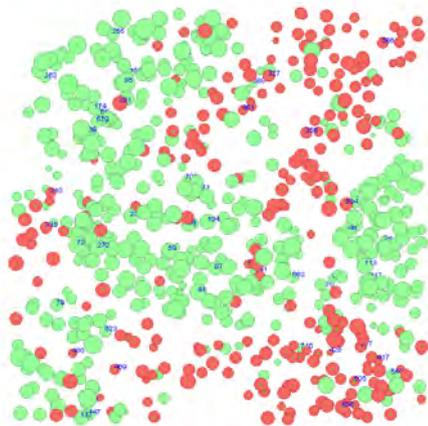

Spatial structures simulation: a combination of point processes

- specific structure: aggregation, random, regularity
- intertype structure: attraction, independence, repulsion

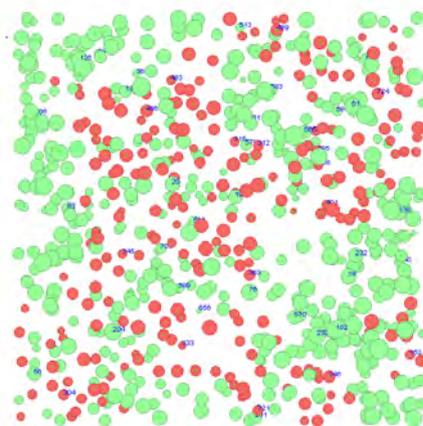

Simulation examples:

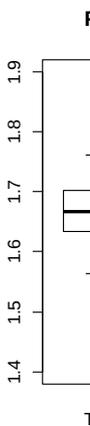

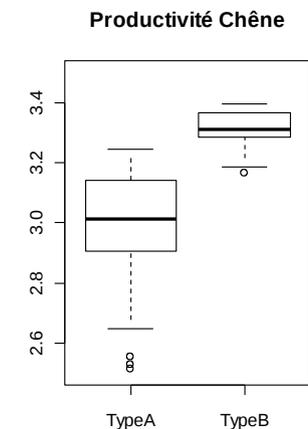

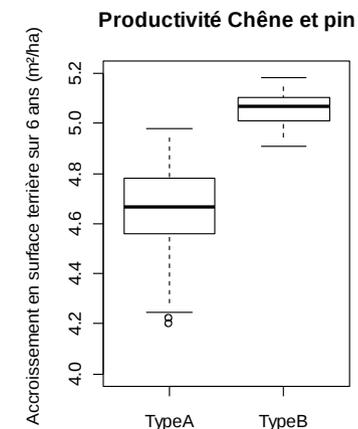

Canopée Type 1, modèle C7
Ss étage Type 2, modèle SE6

Canopée Type 3, modèle C4
Ss étage Type 2, modèle SE6

Script mode, repetitions, example of results:

Ngo Bieng M.-A., Perot T., de Coligny F., Goreaud F., 2013. Spatial pattern of trees influences species productivity in a mature oak-pine mixed forest. **European Journal of Forest Research** (2013) 132:841-850

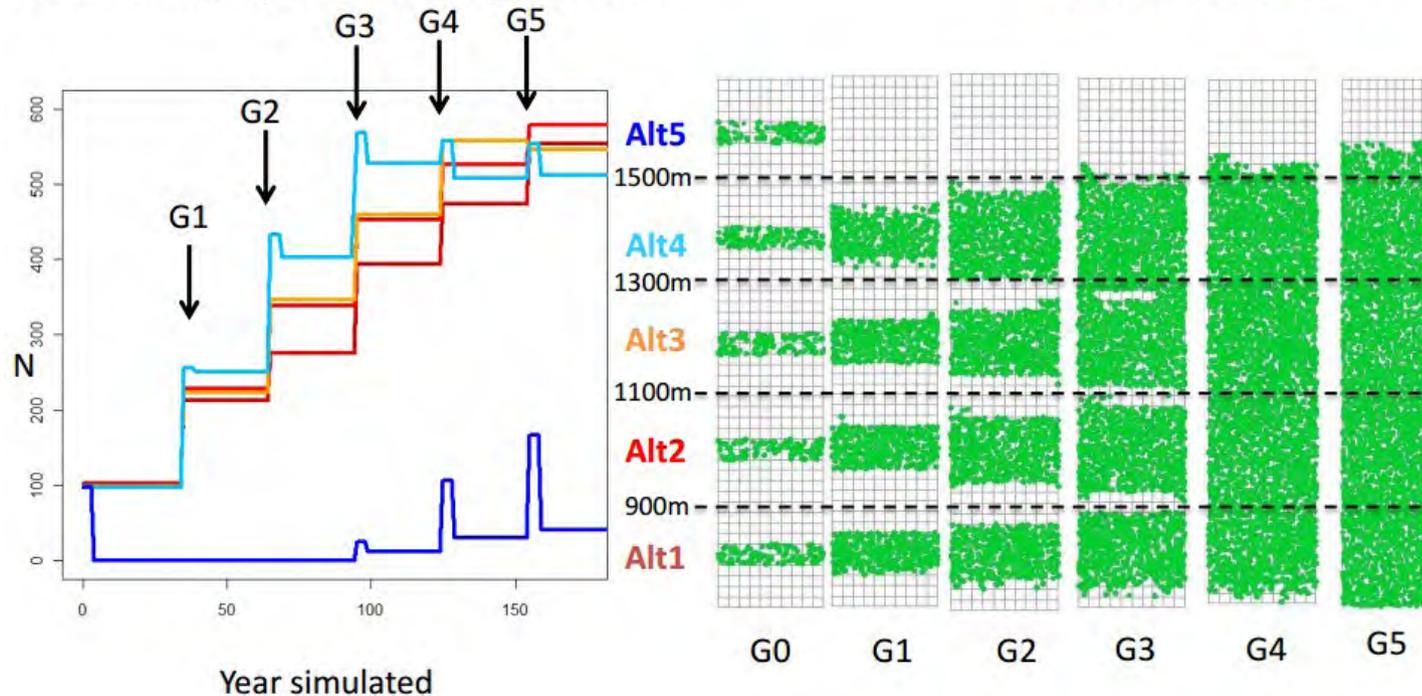

PhysioDemoGenetics

PhysioDemoGenetics aims at studying the genetic adaptation through natural selection driven by climatic variables in a continuous tree population

-> accounts for complex interactions among genes, functional traits and climate when environment or demography are unstable.

It relies on (1) explicit modelling of the genetic determinism of ecophysiology-related traits and (2) the coupling of ecophysiological processes at tree level (Castanea library in Capsis) with dynamical processes (dispersal, growth, mortality) and genetic processes (Genetics library in Capsis)

Results: population dynamics

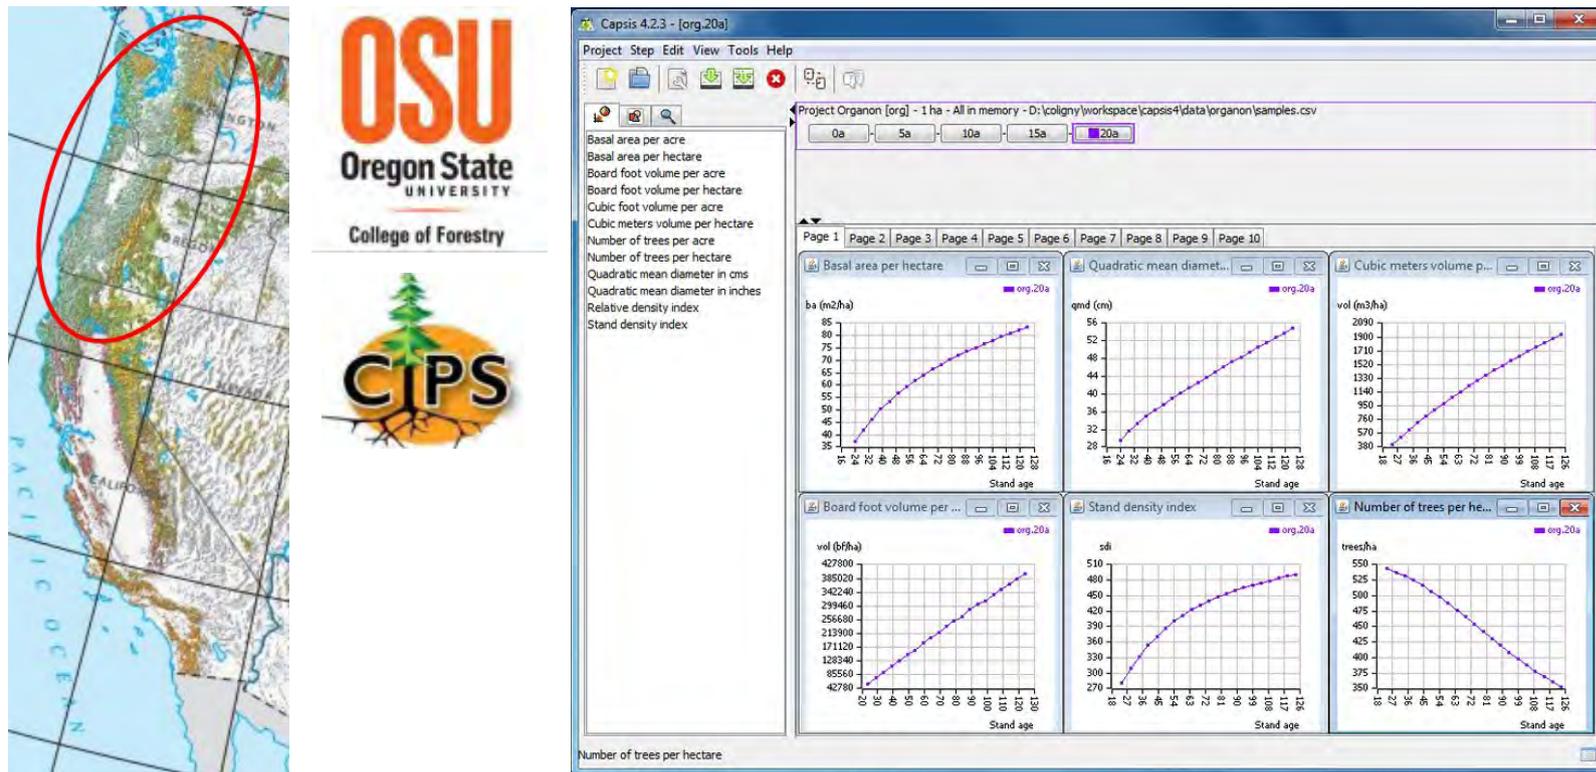

- Extinction of Alt5 at G0 and recolonisation at G3
- Treeline at 1620 m (versus observed =1700 m)

Organon

- Organon is an empirical, spatial implicit, individual tree growth, yield and wood quality model from the Pacific Northwest
- The model will project forest development for several species mixtures, stand structures and silvicultural regimes
- A simplified version of Organon can be accessed through Capsis, works in metric system

Organon is managed by the Center for Intensive Planted-forest Silviculture at Oregon State University

Forecast: partnership with INRA-Lerfob (Francis Colin) and ONF R&D (Christine Deleuze)

- reparameterize Organon equations for french species
- develop wood quality equations for France

Artemis-2009

<http://www.mffp.gouv.qc.ca/publications/forets/connaissances/recherche/Fortin-Mathieu/Memoire156.pdf>

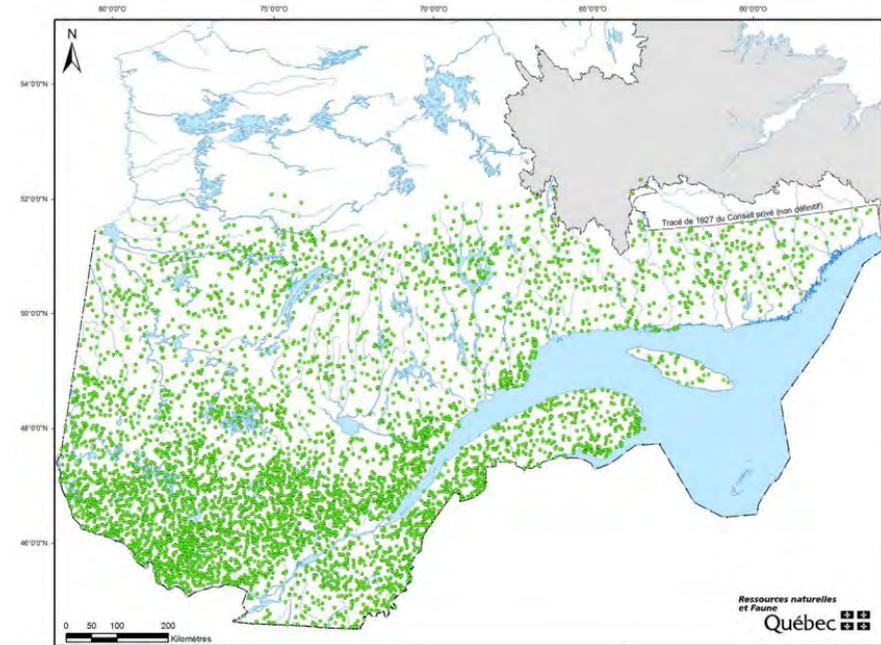

A distance-independent tree model for the main potential vegetations in the province of Québec

Objectives, at the provincial level:

- develop silvicultural strategies
- update sample plots
- calculate the allowable cut

Six sub-models to forecast

- (i) the temporal change of mortality,
- (ii) dbh of surviving stems,
- (iii) the number of recruits, (iv) their diameters, (v) height and (vi) volume using dbh

The permanent plots of the MRNF-DIF in Québec:
12001 plots, from 1970

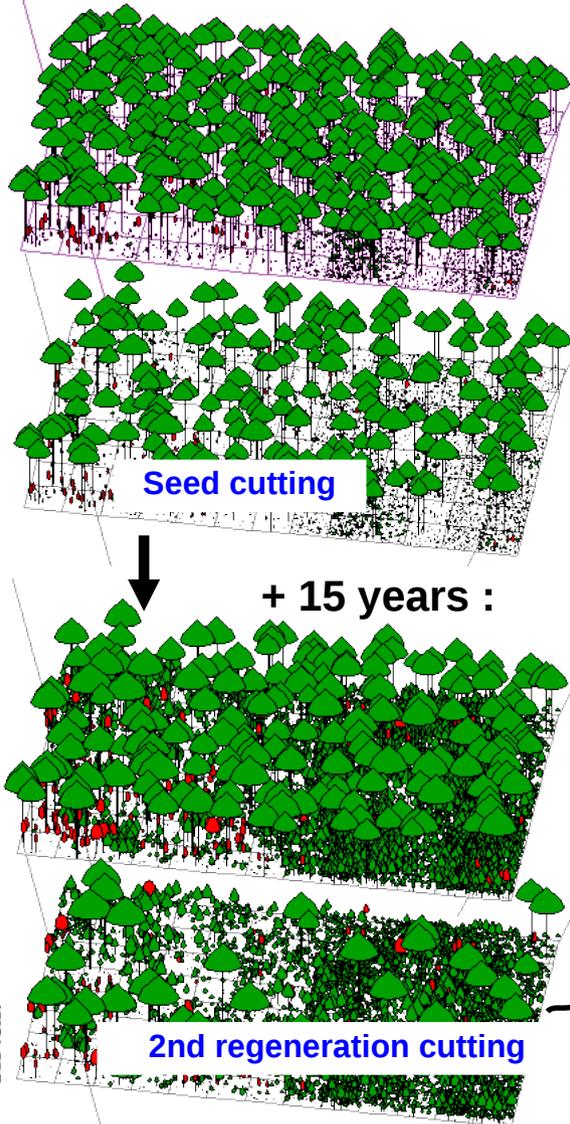

Other Capsis models by Québec MRNF since 2002:

- **Présage** (Daniel Mailly, Sylvain Turbis): a model of production and evaluation of scenarios to help management of forests in Québec
- **SaMARE** (Sadi Aid, Sylvain Turbis): a distance-independent tree model for sugar maple- dominated stands (sugar maple, yellow birch, American beech and other broadleaved species)
- **Natura** (Sadi Aid, Isabelle Auger): a whole-stand model for the province of Québec
- **Succès** (Mathieu Fortin, Luc Langevin): a succession model for the main forest types in Québec
- **Croireplant** (Guy Prigent, Jean Ménétrier, Geneviève Picher et Isabelle Auger): Volume table for white spruce, jack pine and hybrid poplar plantations, and yield tables/stand growth models for white spruce plantations in province of Québec

Ventoux: modelling a forested massif

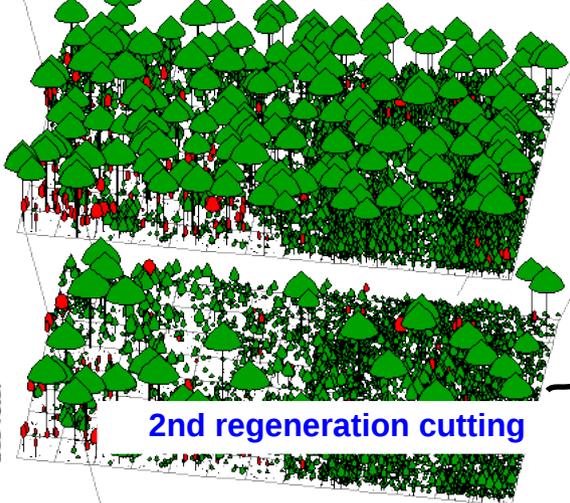

Realistic silvicultural scenario and evolution over 100 years

Initial stand:

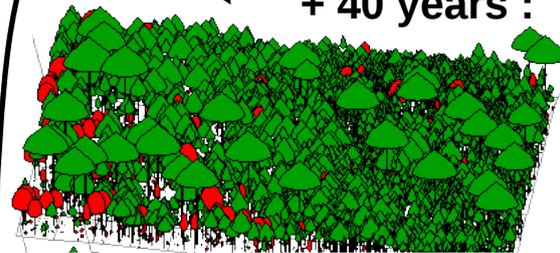

Seed cutting

+ 15 years :

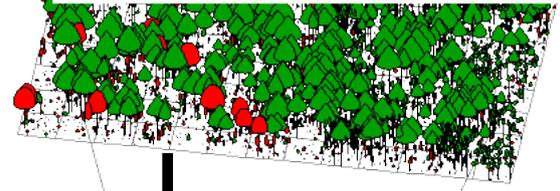

2nd regeneration cutting

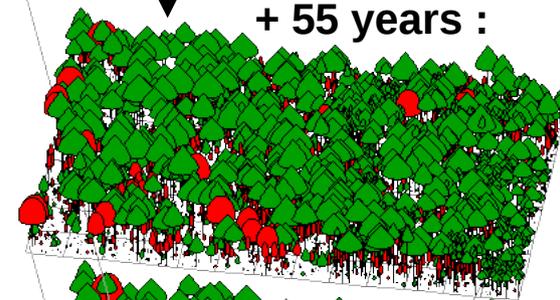

+ 40 years :

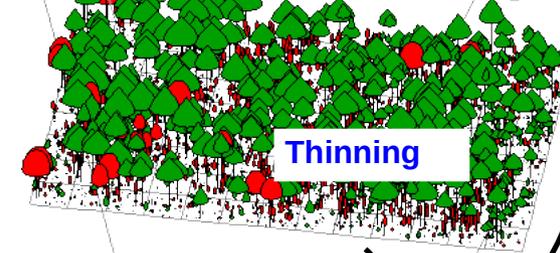

Precommercial thinning
Removal of the last seed trees

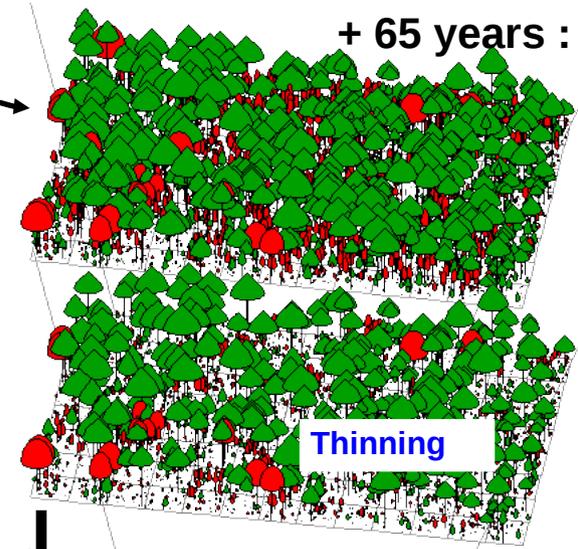

+ 55 years :

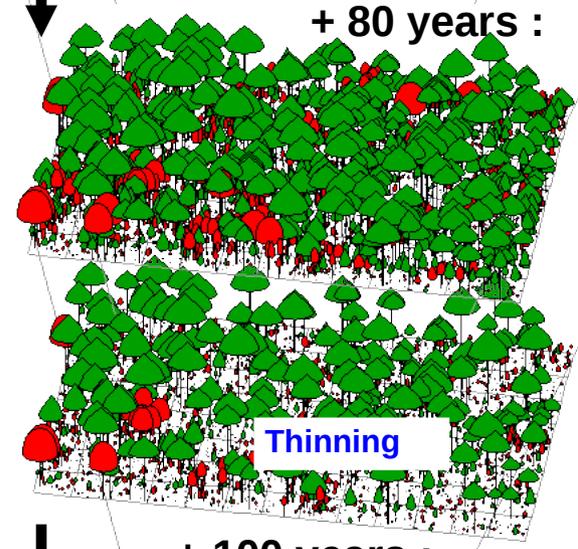

Thinning

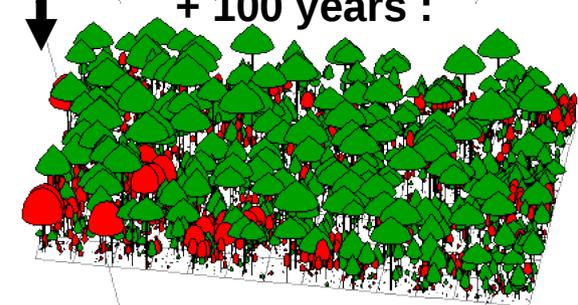

+ 65 years :

Thinning

Thinning

+ 100 years :

Figure 7 : Simulation d'un scénario sylvicole complet réaliste et évolution sur 100 ans d'une plantation de Pin noir (en vert) en cours de colonisation par le Hêtre (en rouge) : régénération par coupes progressives du couvert de Pin, qui bénéficie autant au Hêtre qu'aux semis de Pin ; dressage unique, à l'occasion duquel la proportion des deux essences peut être en partie modifiée (mais le dynamisme du Hêtre et sa faculté à rejeter ne permettent pas de l'éliminer, même si on souhaite favoriser au maximum le Pin) ; éclaircies, en nombre limité compte tenu de la nécessité d'offrir un volume suffisant à chaque intervention pour favoriser la vente des lots.

Simmem: modelling several forests

Simmem is a model simulating the management of several forests at the same time
 Each forest grows with a specific Capsis model according to its species and forest structure
 Connections to Fasy, Fagacées, FTChene, Gymnos, Lemoine, Melies, Laricio, Sylvestris...

Forêt publique - Forêt privée

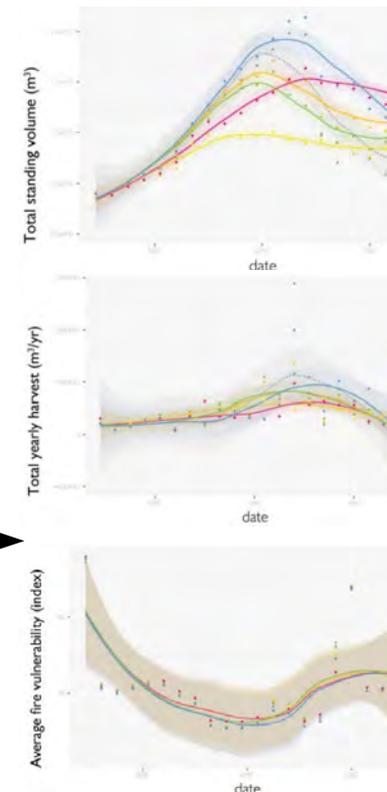

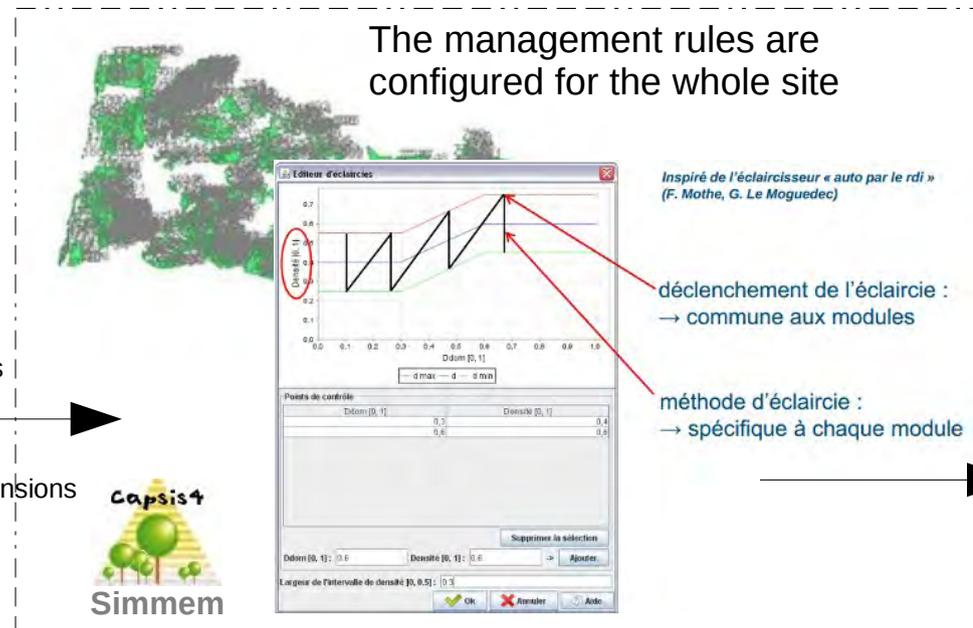

100 000 ha

Scenarios are built by experts and stakeholders according to forest owner behaviour

- scenario 1: Unfinished bioenergy
- scenario 2: Biorefinery innovation & land-use tensions
- scenario 3: The European biomass sink
- scenario 4: The 'Green' innovative cluster
- scenario 5: The territorial partnership

...

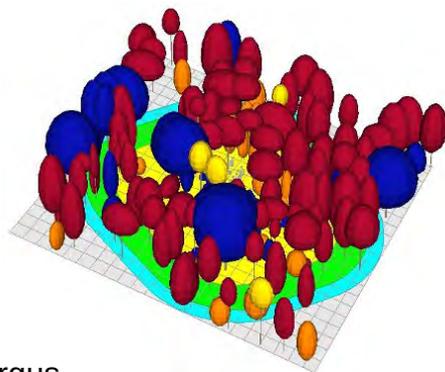

Several teams work together on Simmem...

- P. Vallet, T. Cordonnier (Irstea, Nogent sur Vernisson & Grenoble) **Forgéco project (ANR)**
 -> Forêt d'Orleans, Massif du Vercors
- P. Lejeune, G. Ligot (ULG, Gembloux, Belgium)
 -> Ardennes belges
- C. Orazio (EFIATLANTIC, Bordeaux) **Integral project (EU)**
 -> Aquitaine

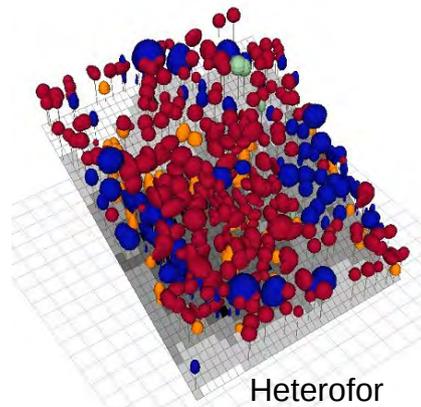

SamsaraLight: a reusable library for radiative balance

A library implementing the radiative balance of the Samsara model, to make it possible to reuse it in other models (Quergus, Heterofor, RReShar, Samsara and Samsara2, Mountain).

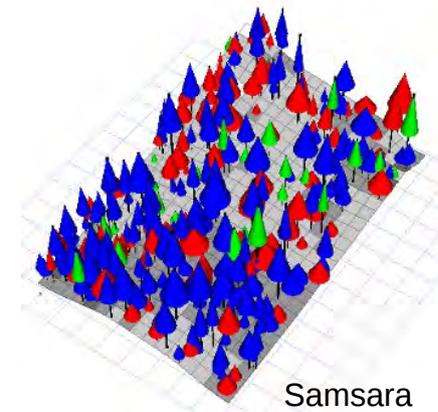

- adaptable to spatialized individual based models
- the crown is a kind of ellipsoid or a cone
- two modes: turbid medium volume or porous envelop
- irradiance (MJ) for each tree and each cell on the ground
- the irradiance can be considered for tree growth

Quergus
(G. Ligot, ULG, Belgium)

Heterofor
(M. Jonard, UCL, Belgium)

Samsara
(B. Courbaud, IRSTEA)

Wood Quality Workshop

Coupled to a growth model (Radiata pine, Maritime pine, Oak), logging algorithms, sawing is possible

The screenshot displays the 'Atelier Qualité du Bois - f.150a' software interface. It features several windows and panels:

- Arbres / Billons**: A tabbed interface with 'Billons' selected.
- Résultats des calculs de billonnages**: A table showing calculation results for different jobs.
- Billons du calcul sélectionné**: A table showing details for a selected calculation.
- Billonnage de chêne**: A dialog box for configuring sawing rules for oak, including a list of products and various parameters.
- Visu billons 2D**: A 2D cross-section of a log showing the internal structure and sawing plan.
- Log viewer 2D**: A 2D cross-section of a log showing the internal structure and sawing plan.

Résultats des calculs de billonnages

- Id job	Type	Statut	Resultat	Lancement	Dernier statut
8	GeoLog	Finished	82 billons	10/03/08 11:44:21	10/03/08 11:44:49
5	Billonnage systématique	Finished	690 billons	15/02/08 16:58:51	15/02/08 17:00:33

Billons du calcul sélectionné

ForEnerChips

Forest Energy Chips : a library to simulate harvesting and transformation processes

- Assess the energy consumption of the forest wood chips chain of production
- Quantify the mineral extraction from the forest plot

First applied on the outputs of a Fagacées simulation

Aims at being compatible with other growth models in Capsis

Capsis-ONF-2014

- a Capsis installer on an ONF server for internal distribution
- upgraded each year (december) by ONF
- with the Capsis developers and modellers
- a single Capsis with 18 modules:

Abial (INRA)

Artemis (MRNF, Québec)

CA1 (INRA)

Fagacées (INRA)

Gymnos (Gembloux, Belgique)

Laricio (Irstea, INRA)

Lemoine (INRA)

Melies (Irstea)

NRG (INRA)

Oakpine1 et 2 (Irstea)

PiceaAbies (FCBA)

PNN2 (INRA)

Pp3 (INRA)

Pseudotsugamenziesii (FCBA)

Regix (FCBA)

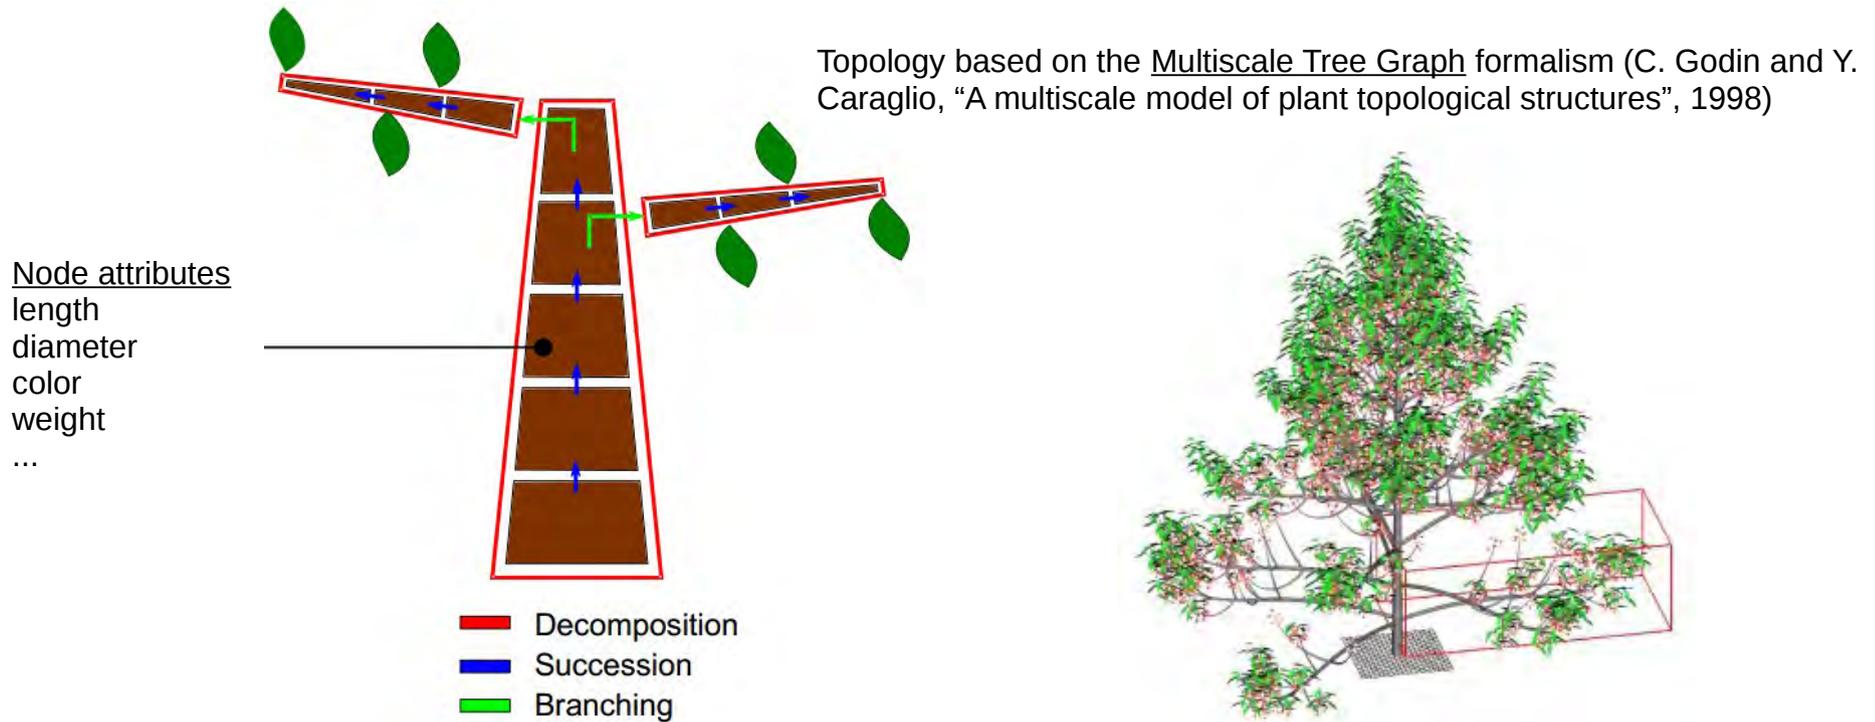

Samsara (Irstea)

Sylvestris (Irstea)

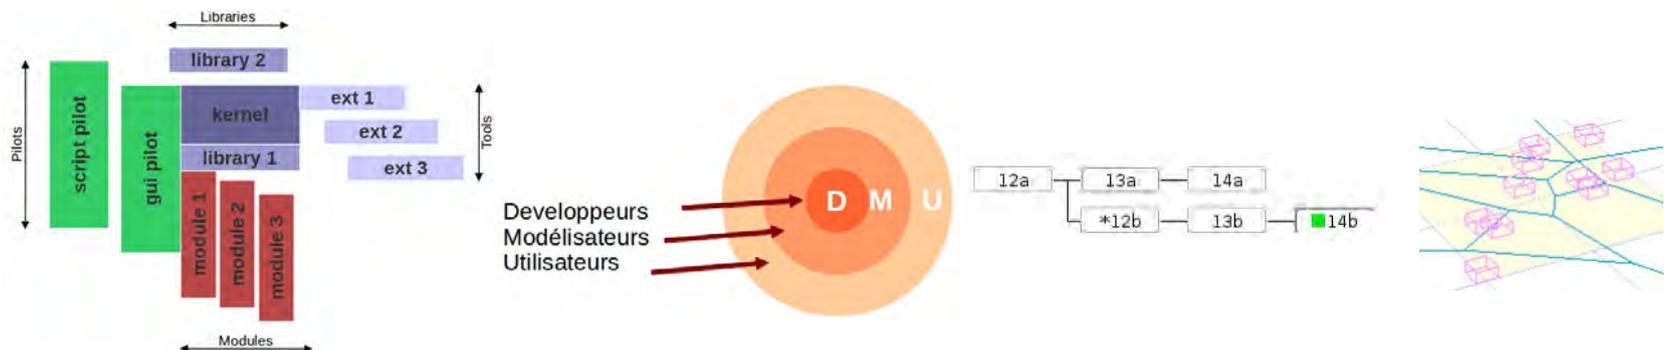

Capsis helps write/update ONF silvicultural guides (about 17 since 2004)
e.g. *Massif Vosgien - Sapin, épicéa et pin sylvestre*, Thierry Sardin (2012)

AMAPstudio: a software suite for plants architecture modelling

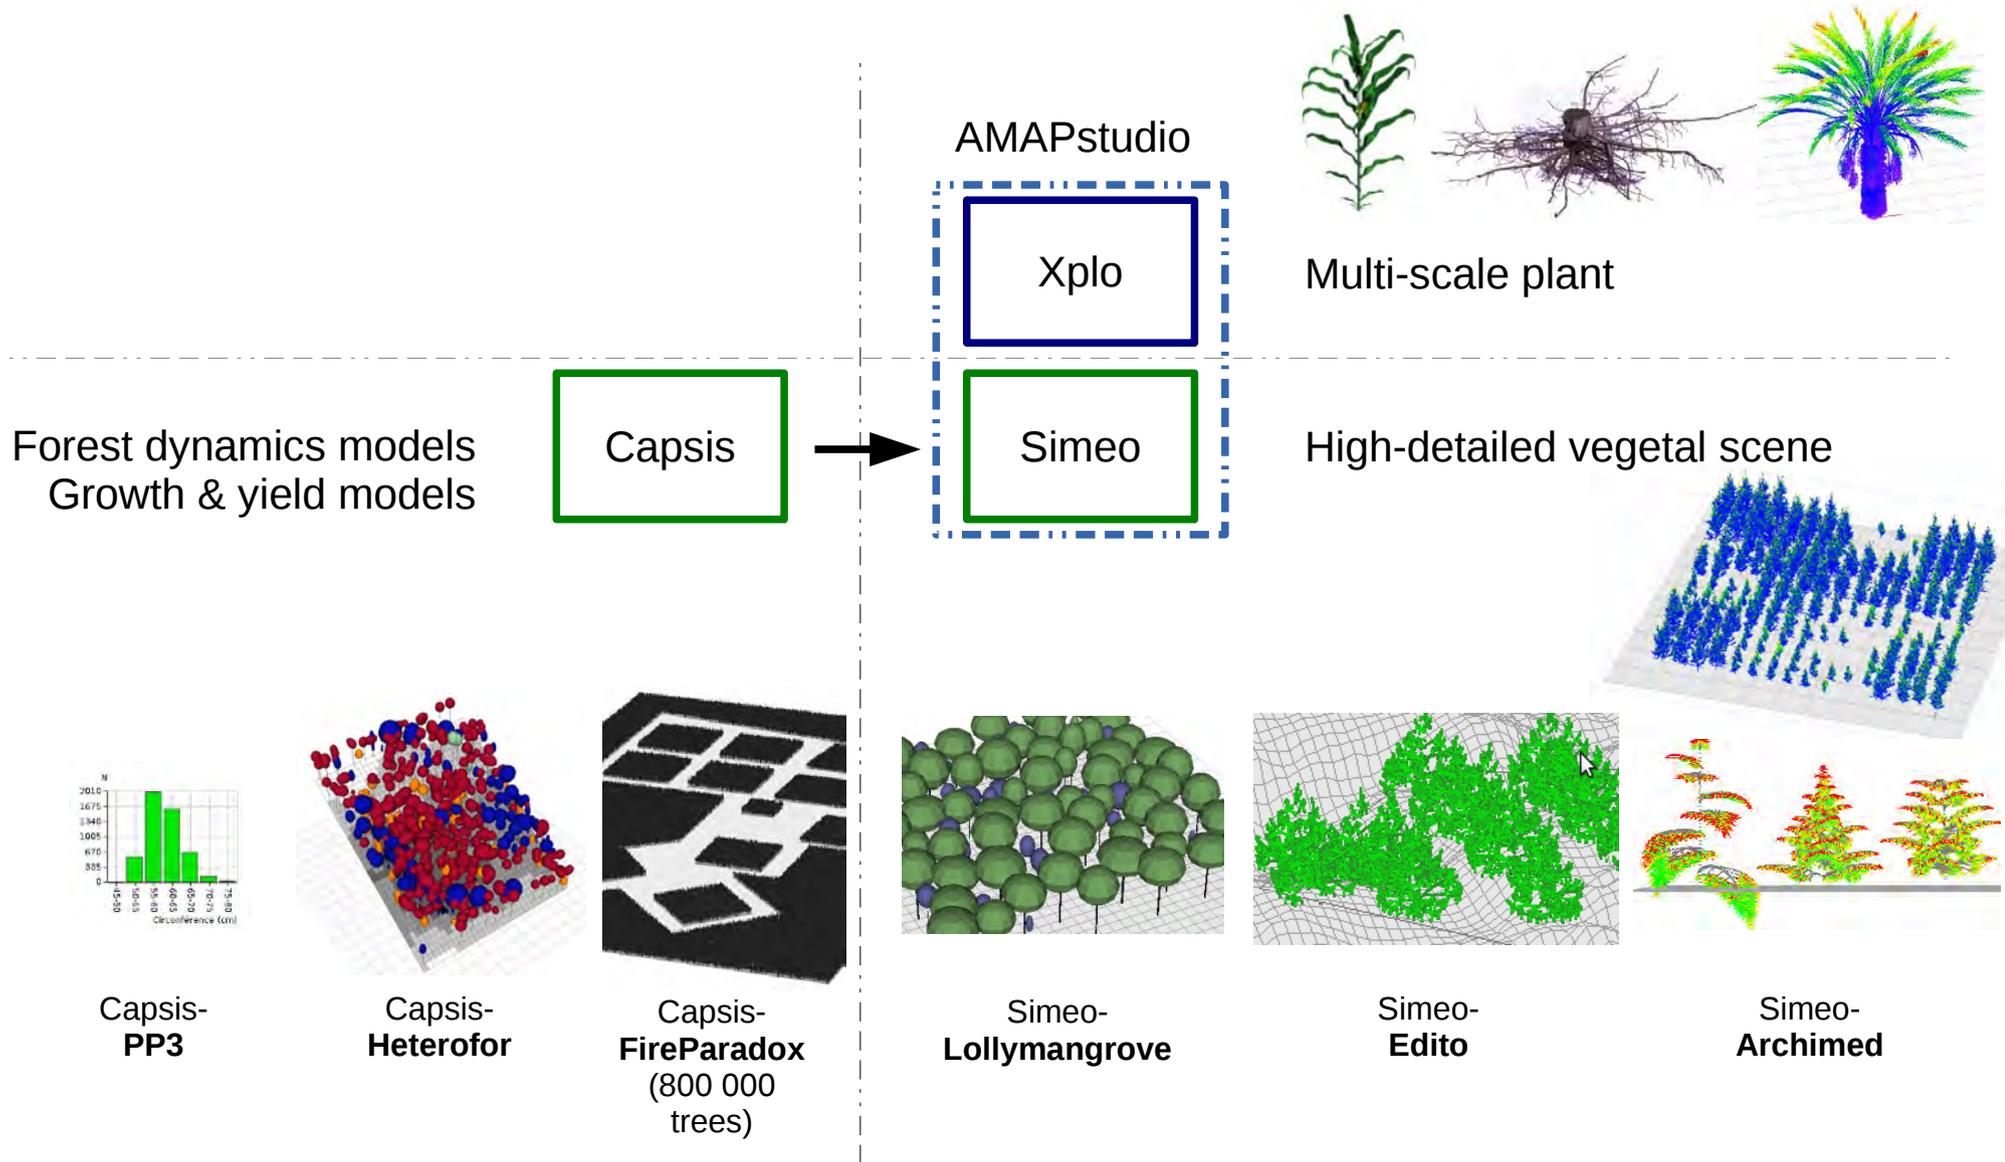

Objectives: Build a **software suite** to provide **editors** and **integrate simulators** for plants multi-scale architecture modelling, for the individual plant or the vegetal scene, for **modellers and teaching**

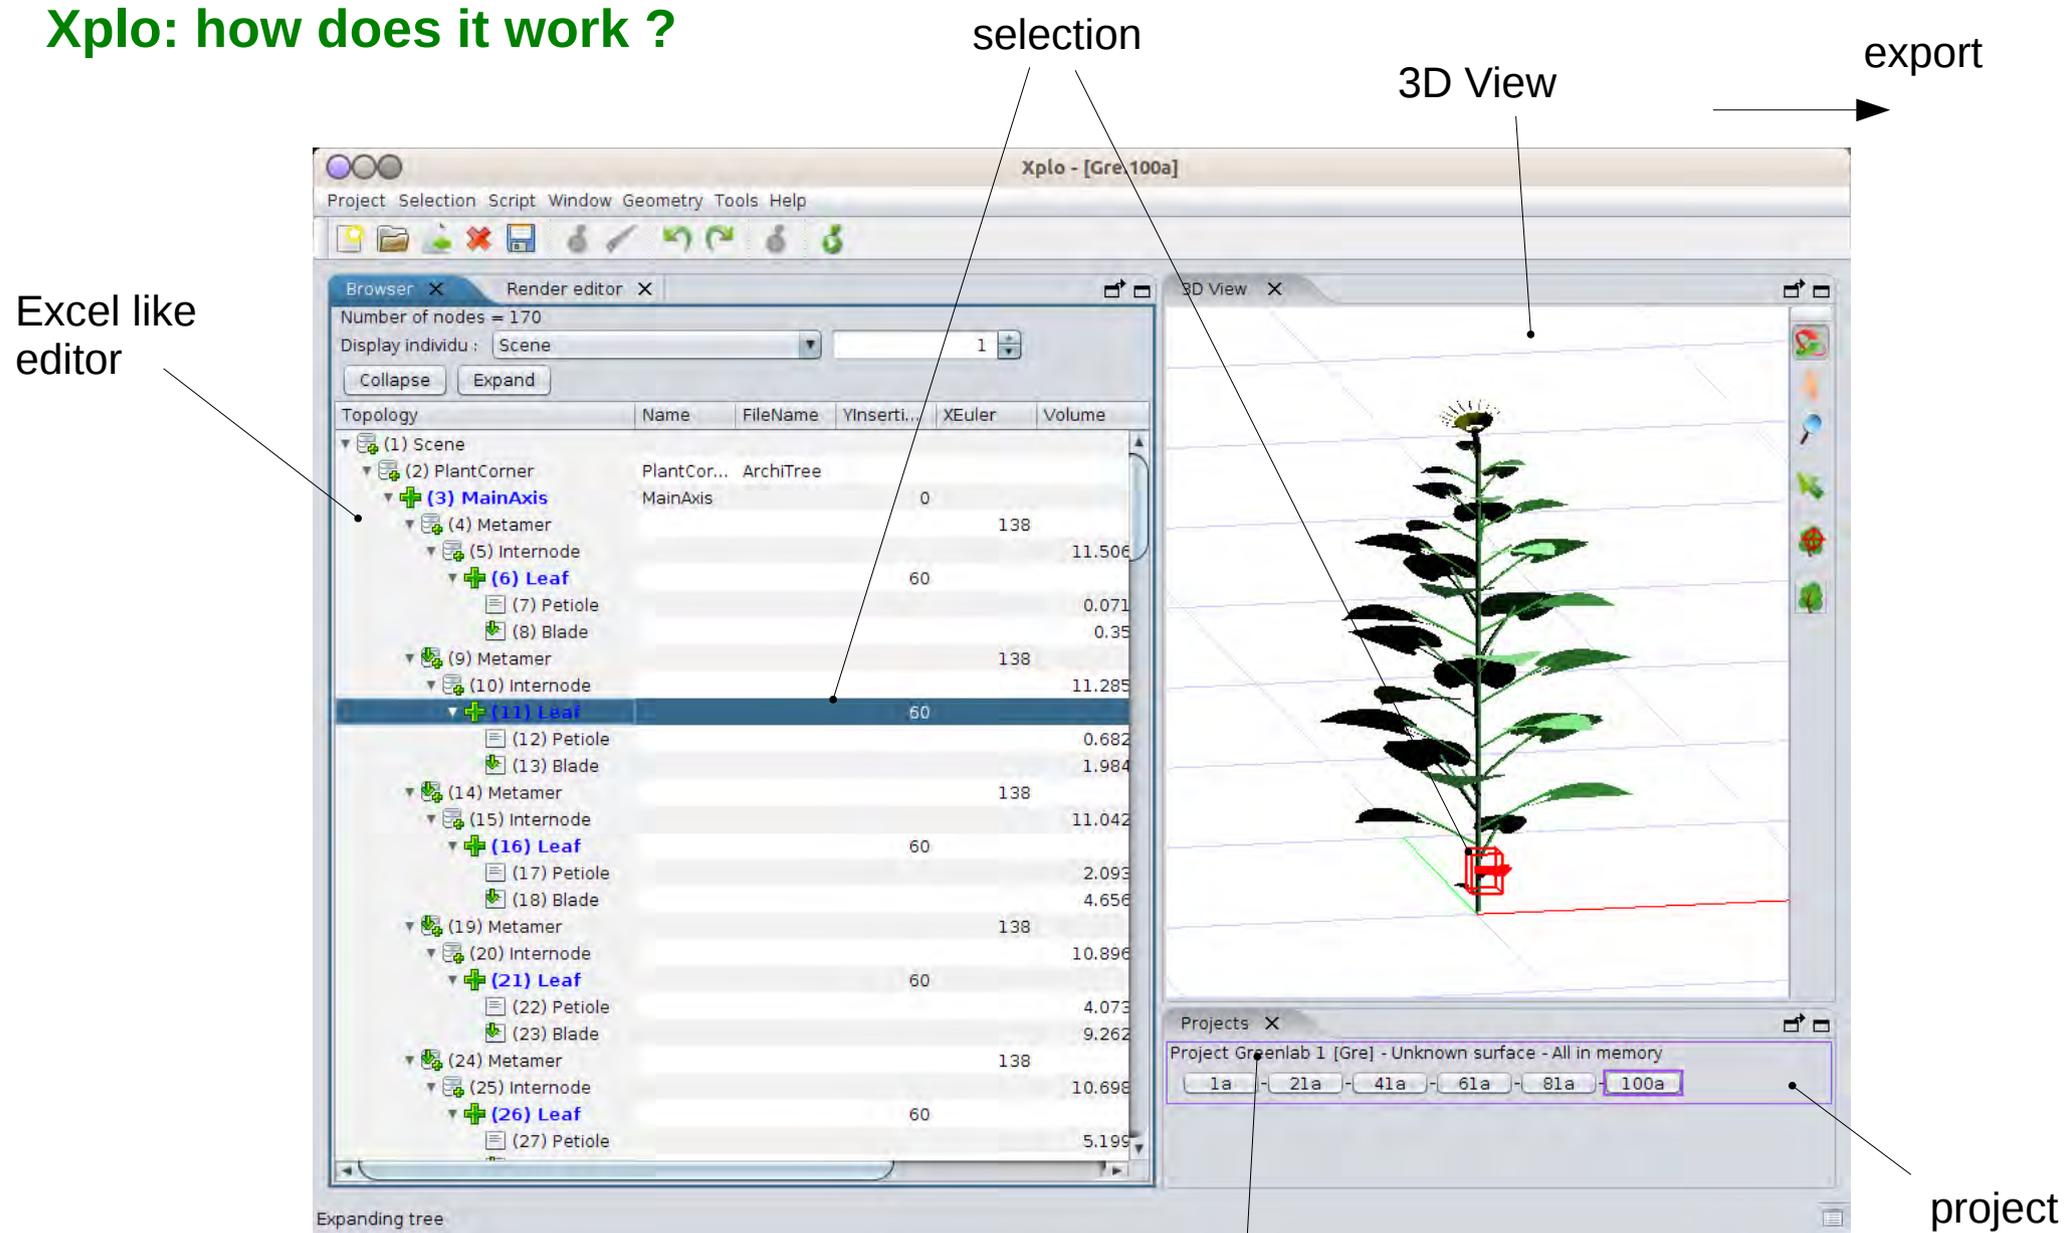

Mutualisation

AMAPstudio: Xplo + Simeo

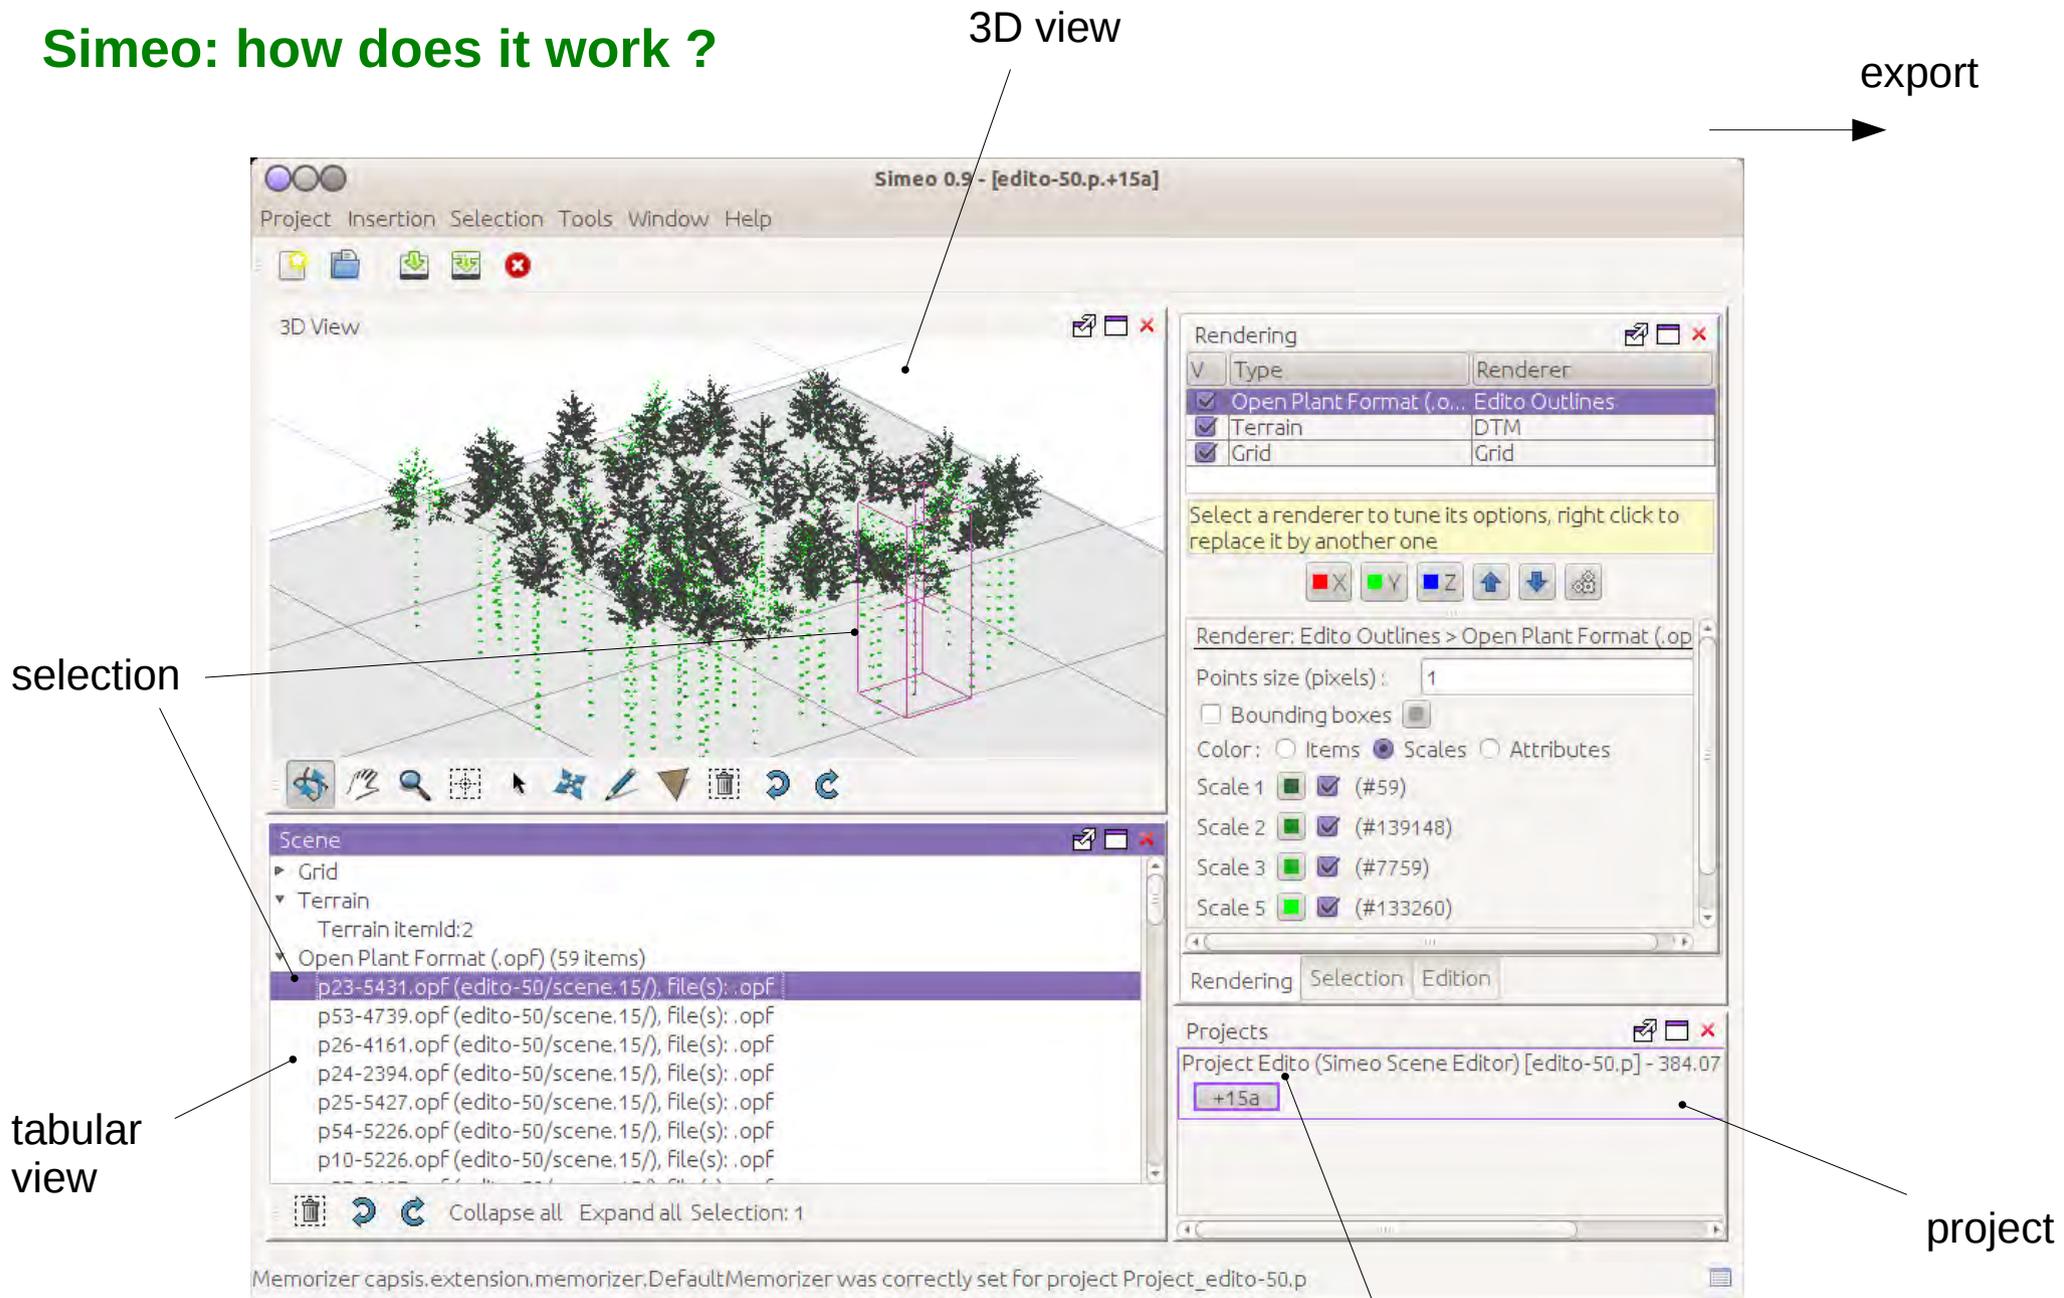

Xplo: how does it work ?

Xplo - Linux - Graphical user interface - English

model : initialisation
+ time loop (optional)

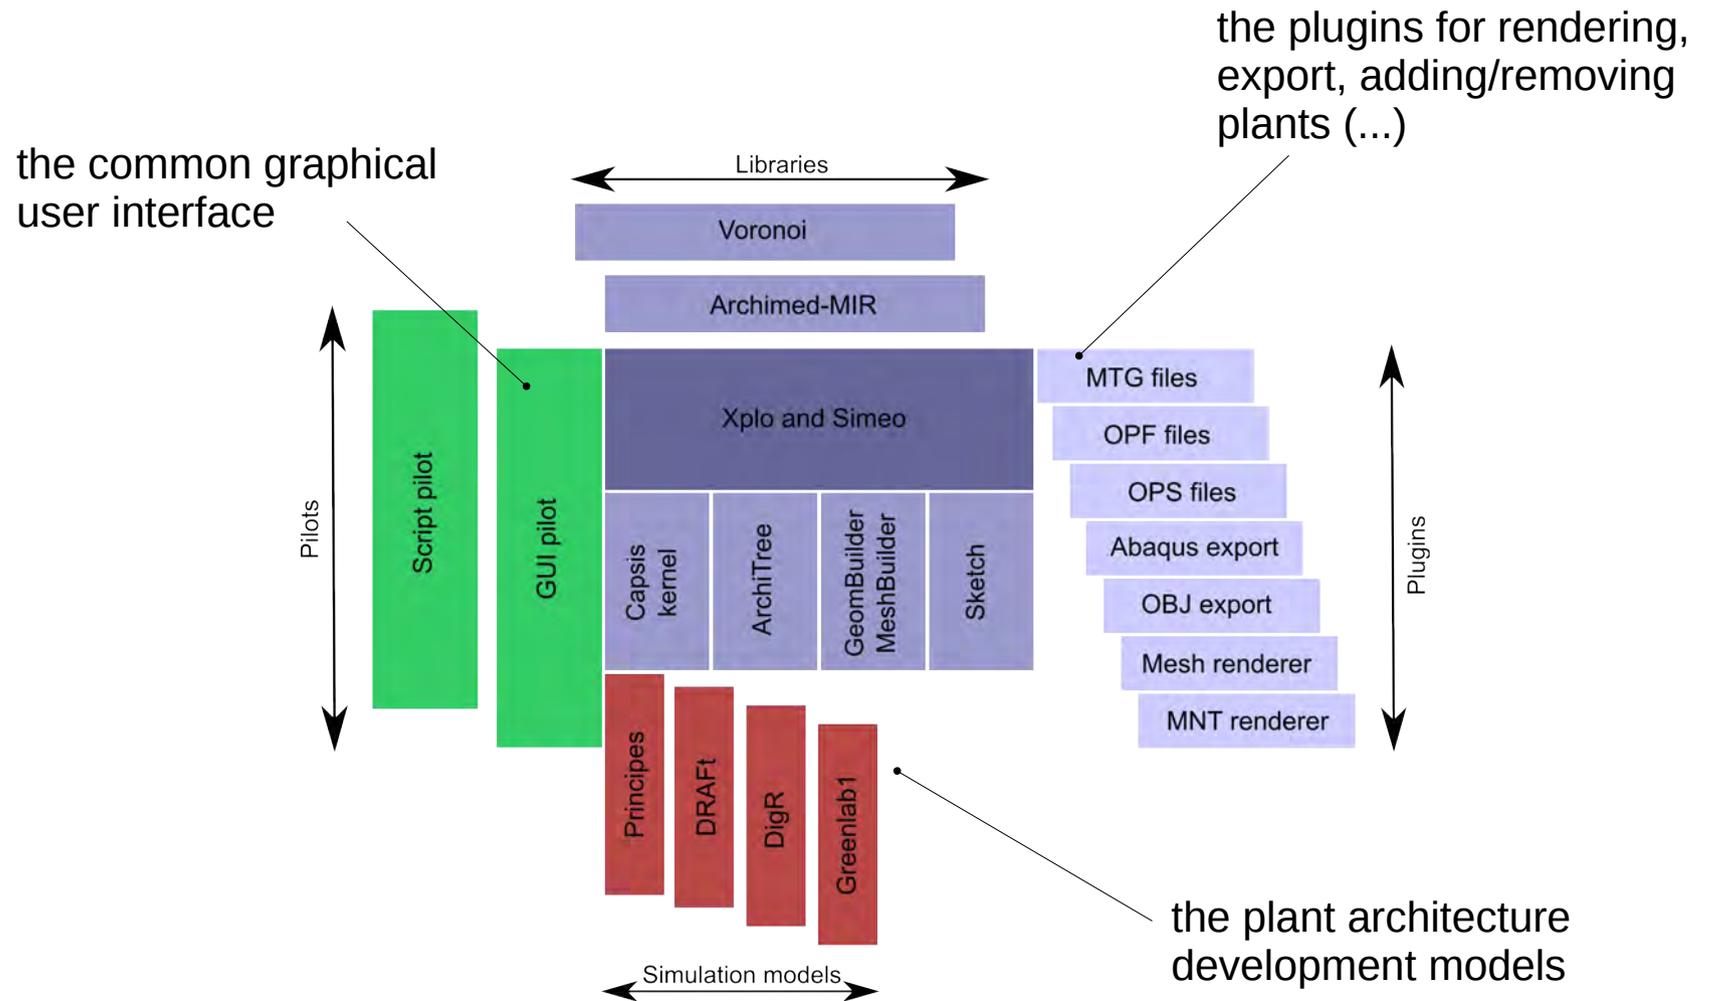

Simeo: how does it work ?

Simeo - Linux - Graphical user interface - English

model : initialisation
+ time loop (optional)

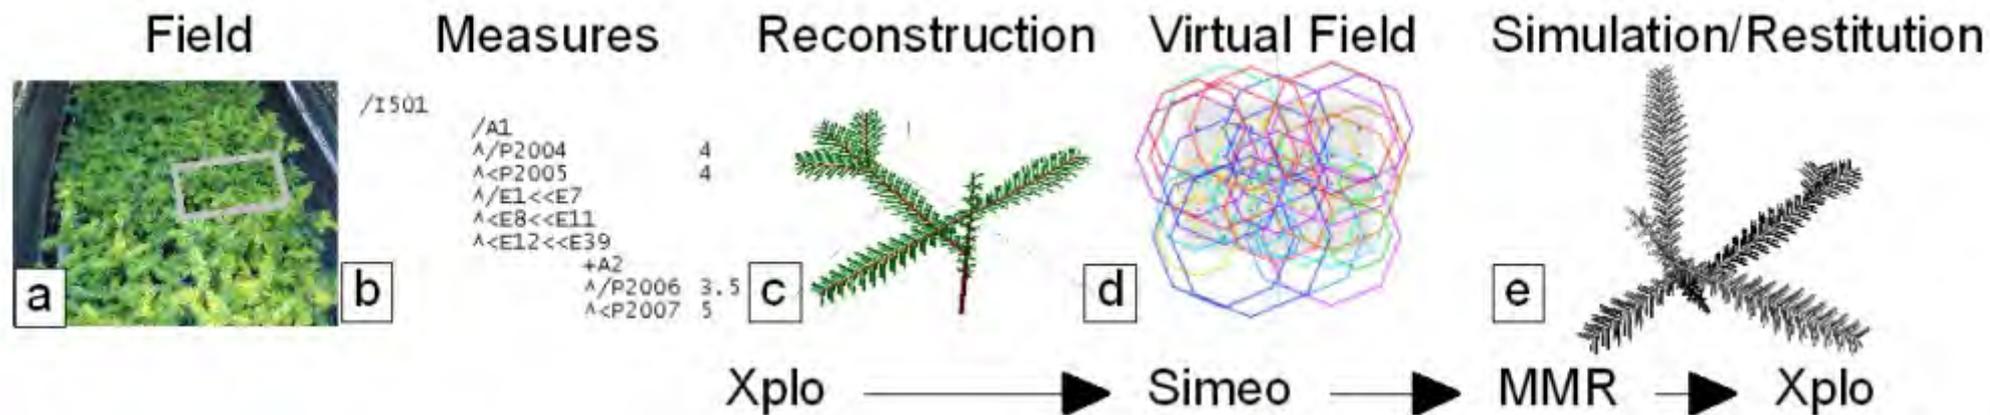

Xplo / Simeo: Software design

Xplo and Simeo editors

- create plants / vegetal scenes interactively
- check and correct them, build geometry
- run biophysical simulations (e.g. biomechanics)
- load and save plant / vegetal scenes
- export to other formats

An example: Retrospective analysis of fir sapling growth vs. light interception (Taugourdeau et al. 2010)

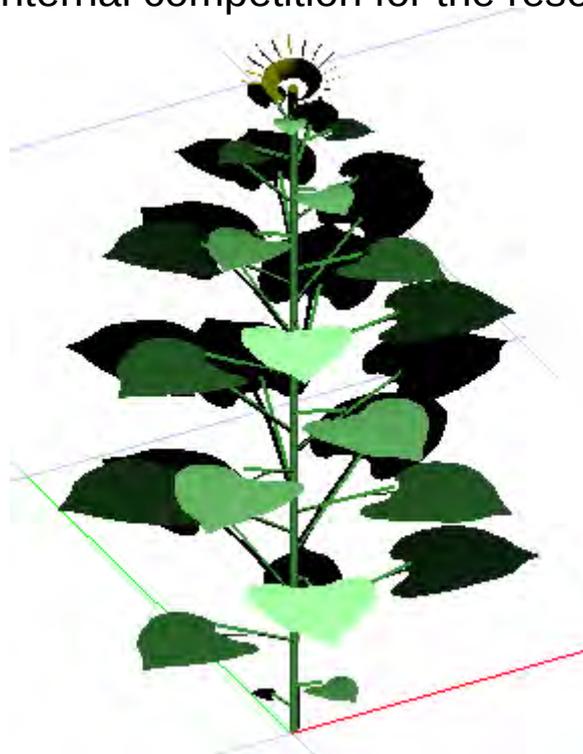

From plot to simulation, (a) view of a subplot in the dry (D) treatment, (b) plant architecture coded in accordance with AMAPMOD/MTG syntax (Godin & Caraglio, 1998), (c) topological and geometrical plant reconstruction with Xplo, (d) stand reconstruction with Simeo, (e) light interception calculated using MMR model and analyses by Xplo

Taugourdeau O., Dauzat J., Griffon S., de Coligny F., Sabatier S., Caraglio Y. & Barthélémy D., 2010. Retrospective analysis of fir sapling growth vs. light interception, Actes du 6ème colloque international sur la modélisation structure-fonction (Functional-Structural Plant Models, FSPM), 12-17/09/2010, Université de Californie à Davis (USA), pages (93-95)

Greenlab 1

- *Greenlab* is a mathematical plant model simulating interactions between plant structure and functions
- biomass produced by organs (sources) is allocated to expanding organs (sinks) according to their relative demand
- plant parameters can be adjusted by fitting on real measurements
- *Greenlab* can compute the plant architecture for various species in interaction with their environment
- this model's underlying concepts can potentially predict the plant's phenotypic plasticity, for instance, pruning affects the internal competition for the resources and may lead to different leaf sizes

de Reffye P, Hu B-G. Relevant qualitative and quantitative choices for building an efficient dynamic plant growth model: GreenLab case. In: Hu B, Jaeger M, eds. Plant Growth Modeling and Applications (PMA03); Proceedings of the 2003 International Symposium on Plant Growth Modeling, Simulation, Visualization and Their Applications; Tsinghua University Press, Springer; 2003. p. 87-107

Principes

- models and simules the development and architecture of vegetative and reproductive parts of date palm (*Phoenix dactylifera* L.) from germination to any age
- a continuation of studies that have been carried out for almost 20 years on palm-tree architecture
- Principes brings a generic, multi-scale, structural model for palm-trees based on the organisation of the various organs
- each organ carries its own attributes (lengths, diameters, branching or deviation angles, inter organs distances, etc.)

InSilEco - Architectural plasticity in ecological communities

- simulate the growth of several tree individuals in a forest stand
- the growth of an axis depends on the amount of light that it and its leaves receive
- the simulation process then combines architectural rules defined at species level (AmapSim), an illumination module used to assess light interception by leaves (MIR), and a coupling of axis growth and ramification capabilities with local light interception

The objective is to assess the effect of competition for light within and between species on the overall structure of the forest stand

Powered by AmapSim, Simeo and Archimed-MMR

CNES-StemLeaf project

- Build realistic 3D stand mockups to simulate a LiDAR retrodiffusion signal
- Case study: a plantation of Maritime pine in the Landes de Gascogne

a 19 years old plantation
of Maritime pine,
simulated with AmapSim,
viewed in AMAPstudio

AmapSim

tree growth according to management and steric pressure

AMAPstudio

mockups edition, parameters edition and extraction

Computree (ONF)

additive processing on mockups and LiDAR data, parameters extraction

DART (Cesbio Toulouse)

aerial LiDAR simulation on the mockups

Exporting to other formats / software

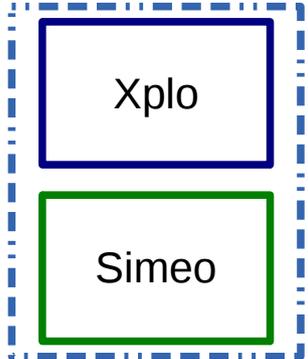

.ops / .opf / .mtg

Abacus

Perspectives

Capsis is in production: 60+ models integrated since 1999

- support new projects starting
- training courses, starting sessions
- permanent support
- annual meeting

AMAPstudio is younger

- improve our software
- support medium / big size projects like Capsis (ANR, European project...)
- find more partners outside the lab
- support simulation models for high detailed vegetation scenes
